The number of Eeyouch/Eenouch with diabetes continues to increase and now includes 2,932 people (26.7% of adults over age 20) – more than one in four.

Women continue to outnumber men, the reverse of the pattern seen elsewhere.

Diabetes in young Eeyouch/Eenouch (under age 40) is a big concern:
- They need to learn to live a healthy life with diabetes
- Only about 1/3 (39.4%) have their glucose at target levels
- 60% of them are showing early kidney damage on their urine test for protein.

Young Eeyouch/Eenouch with diabetes require special attention to help learn to live a healthy life with diabetes, and prevent the progression of kidney damage.

Good news:
- Age at time of diagnosis is slowly getting older
- More and more people have been living, successfully, with diabetes for over twenty years.
